environmental pollution as a consequence of diverse human activities has become a global concern urbanization mining industrial revolution burning of fossil fuels firewood and poor agricultural practices in addition to improper dumping of waste products are largely responsible for the undesirable change in the environment composition environmental pollution is mainly classified as air pollution water pollution land pollution noise pollution thermal pollution light pollution and plastic pollution nowadays it has been realized that with the increasing environmental pollution impurities may accumulate in plants which are required for basic human uses such as for food clothing medicine and so on environmental pollution has tremendous impacts on phenological events structural patterns physiological phenomena biochemical status and the cellular and molecular features of plants exposure to environmental pollution induces acute or chronic injury depending on the pollutant concentration

exposure duration season and plant species moreover the global rise of greenhouse gases such as carbon monoxide carbon dioxide nitrous oxides methane chlorofluorocarbons and ozone in the atmosphere is among the major threats to the biodiversity they have also shown visible impacts on life cycles and distribution of various plant species anthropogenic activities including the fossil fuel combustion in particular are responsible for steady increases in the atmospheric greenhouse gases concentrations this phenomenon accelerates the global heating studies have suggested that the changes in carbon dioxide concentrations rainfall and temperature have greatly influenced the plant physiological and metabolic activities including the formation of biologically active ingredients taken together plants interact with pollutants and cause adverse ecological and economic outcomes therefore plant response to pollutants requires more investigation in terms of damage detection adaptation tolerance and the physiological and molecular responses the complex interplay among other emerging pollutants namely radioisotopes cell phone radiation nanoparticles nanocomposites heavy metals etc and their impact on plant adaptation strategies and possibility to recover mitigation phytoremediation etc also needs to be explored further it is necessary to elucidate better the process of the pollutant s uptake by plant and accumulation in the food chain and the plant resistance capability against the various kinds of environmental pollutants in this context the identification of tolerance mechanisms in plants against pollutants can help in developing eco friendly technologies which requires molecular approaches to increase plant tolerance to pollutants such as plant transformation and genetic modifications pollutant induced overproduction of reactive oxygen species that cause dna damage and apoptosis related alterations has also been examined they also trigger changes at the levels of transcriptome proteome and metabolome which has been discussed in this book

metal toxicity and deficiency are both common abiotic problems faced by plants while metal contamination around the world is a critical issue the bioavailability of some essential metals like zinc zn and selenium se can be seriously low in other locations the list of metals spread in high concentrations in soil water and air includes several toxic as well as essential elements such as arsenic as cadmium cd chromium cr aluminum al and selenium se the problems for some metals are geographically confined while for others they are widespread for instance arsenic is an important toxic metalloid whose contamination in southeast asia and other parts of world is well documented its threats to human health via food consumption have generated immense interest in understanding plants responses to arsenic stress metals constitute crucial components of key enzymes and proteins in plants they are important for the proper growth and development of plants in turn plants serve as sources of essential elements for humans and animals studies of their physiological effects on plants metabolism have led to the identification of crucial genes and proteins controlling metal uptake and transport as well as the sensing and signaling of metal stresses plant metal interactions sheds light on the latest development and research in analytical biology with respect to plant physiology more importantly it showcases the positive and negative impacts of metals on crop plants growth and productivity

cyclodextrins in pharmaceuticals cosmetics and biomedicine covers a wide range of knowledge on cyclodextrins from an overview of molecular and supramolecular aspects of cyclodextrin physicochemistry to the latest outcomes in cyclodextrin use and future possibilities in the employment of these systems this book focuses on the derivatives and physicochemical and biological properties of cyclodextrins and considers drug delivery through topical mucosal and oral via cyclodextrin complexes

carbon dots in food packaging and preservation provides an introduction to carbon dots cds and explores their practical application in food packaging addressing common challenges such as the need for safer food storage longer shelf life and eco friendly packaging solutions the book begins with a comprehensive overview of the basic principles of cds and their unique properties relevant to this industry such as their ability to fight germs prevent food spoilage and shield against harmful uv rays which are crucial for improving food quality and safety it then discusses their various applications and practical uses in creating innovative packaging materials smart packaging systems and sensors that respond to changes in food quality and counterfeiting showcasing the potential of cds in addressing key issues in food packaging technology this book provides practical insights into the use of cds for active and intelligent packaging serving as a valuable resource for scientists industry professionals and policymakers seeking sustainable and effective solutions in food packaging practices provides a detailed overview of the basic principles and unique properties of carbon dots cds relevant to food packaging and preservation introduces the latest innovations in cds including new manufacturing methods relevant to applications in food packaging technology addresses common challenges in food packaging offering sustainable and effective solutions for safer food storage and longer shelf life

molecular clusters in the broad sense that the term is commonly understood today comprise an enormous class of species extending into virtually every important area of chemistry naked metal clusters transition metal carbonyl clusters hydrocarbon cages such as cubane c₈h₈ and dodecahedrane c₂₀h₂₀ organometallic cluster complexes enzymes containing fe s or mofe s₄ clusters high polymers based on carborane units and of course the many kinds of polyhedral borane species so large is the area spanned by these diverse classes that any attempt to deal with them comprehensively in one volume would to say the least be ambitious and also premature we are presently at a stage where intriguing relationships between the various cluster families are becoming apparent particularly in terms of bonding descriptions and despite large differences in their chemistry an underlying unity is gradually developing in the field for example structural changes occurring in fe s cores as electrons are pumped in and out in some measure resemble those observed in boranes and carboranes the cleavage of alkynes via incorporation into carborane cages and subsequent cage rearrangement a sequence familiar to boron chemists is a thermodynamically favored process which may be related to the behavior of unsaturated hydrocarbons on metal surfaces analogies of this sort have drawn attention from theorists and experimentalists
